

Check tasks List Web App

This project is a simple web-based Check List application that is built using HTML, CSS and Javascript.

This app allow users to manage and keep check of tasks directly from the browser.

Features:

1. Add new tasks
2. Mark tasks as completed
3. Delete tasks
4. Edit existing tasks
5. Assign categories
6. Persist the tasks using Local Storage

Approach

The application use a simple client – side architecture

HTML

Provdes the structure of the page that include the task input field, category dropdown and and add button .

CSS

Style the interface to make it look clean and user- friendly

Javascript

Handle all the interactions such as adding , editing ,deleting and completing data.

Challenges Faced

1. Undefined container elements

The code referenced to taskContainer before creating it and cause a runtime error that stopped the script.

2. Unsupported prompt

The environment used to run the app that did not support prompt().The editing function was changed to use the existing input field instead of the the browser prompt.

How to run the app

1. Save the complete code as to-dol list.html
2. Open file in vscode and run it on integrated browser.
3. Type task in input field
4. Select the categories from the dropdown .
5. Click Add button to create the task.
6. When edit the task , type task in input field and click Edit button.
7. Mark the task when completed by clicking onto the task.
8. Click Delete button for task management.
